FM H₂ Compatible Combustible Gas – Catalytic Bead
(0 - 100 %LEL)
Part No. 823-0211-32

Minimum Indicated Concentration ............ 3 %LEL
Repeatability .................................................. ± 2% of Reading
Accuracy1,2 .................................................. ± 10% of Reading
Span Drift .................................................. < 10% change per year (typical)
Response Time (Rise)3 ................................... T₆₀: < 5 seconds
Recovery Time (Fall)3 ....................................... T₁₀: < 30 seconds
Temperature Range ...................................... -20° to 50°C (-4° to 122°F)
Humidity Range (continuous) ...................... 0–90 %RH, non-condensing
Humidity Range (intermittent) ..................... 0–99 %RH, non-condensing
Pressure Range .............................................. Ambient atmospheric, ± 1 psi
Expected Sensor Life4 .................................. 3 years from Shipping Date
Recommended Calibration Flow Rate .......... 500 to 1000 cc/min
Oxygen Requirement................................. 10% by volume, minimum
SensAlert 4-Channel Controller.................... Compatible

1 For both Hydrogen and Propane.
2 When unit is calibrated and serviced at recommended intervals.
3 Room Temperature, hydrogen gas.
4 Sensor life will be shortened by overexposure to combustible gases.

Gas Interference Note: This sensor is optimized for use with hot burning gases such as hydrogen, acetylene, and ethylene oxide, it is not hydrogen specific. This sensor has approximately the same gas interferences as listed in the propane k-factor data of the regular SensAlert™ Plus catalytic bead combustible sensor specification.
Special Calibration Considerations:

H₂ Compatible Catalytic Bead Combustible Sensor (PN° 823-0211-32)

Zeroing The Sensor
There are no special zeroing considerations for this sensor. Complete zeroing instructions are provided in the SensAlert Plus User Manual.

Span Calibration
It is recommended that this sensor be calibrated at the half-scale concentration of 50 %LEL hydrogen gas, 50%LEL of the target gas, or 50%LEL propane if propane is used as a surrogate gas. Complete span calibration instructions are provided in the SensAlert Plus User Manual. It is not recommended that this sensor be calibrated or tested with methane.

Note: The SensAlert™ Plus transmitter must be set for “Other” as gas type, and “None” as k-factor when calibrating with hydrogen.

Test-on-Demand Cell
There is no Test-On-Demand cell recommended for this sensor.

Inhibition & Poisoning
Inhibition and poisoning occur when the combustion by-products from some compounds are deposited onto the catalytic device within the sensor assembly. These depositions will deactivate the sensor. The degree of deactivation may be either partial or complete, and may be either reversible or irreversible, depending upon the concentration and duration of exposure to the interfering compound. The sensor assembly should never be exposed to any of the following substances known to inhibit and poison the catalytic device:

• Silicon-containing compounds, such as silicone oils and greases
• Phosphorous-containing compounds, such as pesticides
• Sulfur-containing compounds, such as carbon disulfide and hydrogen sulfide
• Halogen-containing compounds, such as fluorocarbons and chlorocarbons
• Lead-containing compounds, such as anti-knock petroleum additives

Following exposure to a poisonous substance, the transmitter must be re-calibrated in order to assure that the sensor assembly has not been damaged. If calibration is not successful, the catalytic device has been damaged and the sensor assembly must be replaced.
